

## Calling PL/SQL Procedure from OAF Page

To invoke a stored procedure from within an entity object or an application module, you need to follow below steps:

1. Create a CallableStatement with the PL/SQL block containing the stored procedure invocation
2. Bind any parameters ( IN or OUT )
3. Execute the statement.
4. Optionally retrieve the values of any OUT parameters or return value of function
5. Close the statement.

below example will exemplify the above steps

### **Stored Procedure with OUT parameter**

```
public void testStoredProcedure() {  
  
    OADBTransaction txn = getDBTransaction();  
    CallableStatement callableStatement = txn.createCallableStatement("begin  
        mmm_procedure(:1, :2); end;", OADBTransaction.DEFAULT);  
    try  
    {  
        callableStatement.registerOutParameter(2, Types.VARCHAR);  
        callableStatement.setString(1, "mahi");  
        String outParamValue = null;  
        callableStatement.execute();  
        outParamValue = callableStatement.getString(1);  
        callableStatement.close();  
    }  
    catch (SQLException sqle)  
    {  
        callableStatement.close();  
    }  
}
```
